Rear Factory Bump Stop Modification

The following illustration provides you with a visual of how the rear factory bump stops (rubbers) are installed on the rear shocks of '89 and earlier 911's and 930's. This is very important to know because if you lower the car beyond a certain point, the shocks will bottom out on the bump stops prematurely and send the spring rates through the roof, resulting in very unpleasant - even diabolical handling characteristics. Something as simple as this in the rear of a car can cause it to suddenly oversteer or even snap-spin.

The illustration shows the bump rubber before and after.
